

Interview Report

Interview 1

L. Leiter, 37, Marketing Manager, Munich (Originally from Berlin)

Block 0 – Introduction

- 1. Could you briefly tell us where you live and how you get around in your everyday life?**

I live in Neuperlach with my partner and our six-year-old son. We're a pretty active family, so I mix different ways of getting around, biking to nearby shops, taking the U-Bahn when the weather is bad, and driving our electric car for work or weekend trips. I work in a marketing agency about eight kilometres away, so on most weekdays I drive there in the morning, drop my son at kindergarten, and then park in the office garage that has chargers.

- 2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason?**

Yes, we've had a Volkswagen ID.3 for a little over two years now. The decision came gradually, first from frustration with rising fuel prices, but also because we wanted to reduce our environmental footprint. My company started offering incentives for leasing electric cars, which made the switch easier financially. My partner was skeptical at first because of the range, but after trying a few models, he completely changed his mind.

- 3. How important is sustainability or e-mobility to you in general?**

It's very important, not just as a personal preference but as part of a broader lifestyle. I try to make sustainable choices whenever possible we compost, buy local produce, and travel by train instead of short-haul flights. Driving an electric car fits naturally into that mindset. It's not only about feeling good morally; it also just makes sense in a modern city like Munich.

- 4. How many people in your household or circle of friends already have an electric car?**

Quite a few now. In our immediate circle, at least five families own or lease one. Two of my closest friends recently switched after seeing how smoothly it works for us. Even my brother in Berlin is now considering it, though he says charging infrastructure there still isn't as reliable.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

The first thing that comes to mind is how quiet it is. That sense of calm when you drive through the city early in the morning is something I didn't expect to value so much. Then there's the convenience no more trips to petrol stations, no oil changes, and very little maintenance. I also like that we can pre-heat the car in winter while it's still plugged in. And of course, there's the emotional side: knowing that we're contributing, even a little, to cleaner air for our son's generation.

2. And what is currently preventing you (or others you know) from doing so?

Most people I know who hesitate mention two things price and charging access. Buying new is still more expensive than a combustion car, even with subsidies. But the bigger issue is infrastructure. Not everyone has a private parking space or the ability to install a wallbox, and public chargers can be unpredictable. Those barriers discourage a lot of potential buyers.

Block 2 – Everyday life / current charging situation (for electric car owners)

1. How do you currently charge your car? At home, in public, at work, on the road?

Most of the time, I charge at home. Our apartment building's underground garage already had a shared setup for wallboxes, and we were able to reserve one of the slots. We also have a simple booking app that helps neighbours coordinate usage. I occasionally charge at work too my company installed several chargers for employees, which is very convenient.

2. How well does this work for you in everyday life? Where does it work well, where does it fall short?

It works extremely well now, but it took a while to get there. When we first applied to use the wallbox, there were weeks of paperwork and technical checks. Once that was done, everything became effortless. The only shortcoming is when we travel outside Munich sometimes fast-chargers along the Autobahn are occupied or not functioning properly, which can add stress to longer trips.

3. Have there been times when you couldn't find a charging point or had to change your plans?

Only once. Last winter, on our way back from Innsbruck, two chargers at a rest stop were frozen and offline. We had to wait about thirty minutes until another car finished. It wasn't a huge problem, but it reminded me that charging infrastructure still depends heavily on maintenance quality. In Munich itself, though, it's rare to have such issues.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

The bureaucracy of installing and approving wallboxes. Our property management required multiple permissions and insurance documents before connecting us. For renters, it's even worse many of our friends gave up because their landlords didn't want to deal with it. That's still a major barrier.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Not really for us, but in the first few months, when the paperwork dragged on, it felt exhausting. If we hadn't already made the financial commitment, maybe we would've postponed the decision. But once you start driving electric, it's hard to imagine going back.

3. If you live in an apartment building or rental property: What is the attitude towards wallboxes there?

Mixed. Some neighbours were enthusiastic, others complained about costs and electricity use. Over time, though, attitudes softened — now people see that it's quiet, safe, and not as complicated as they imagined. We've even inspired two other tenants to apply for wallboxes.

4. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?

Yes, we did it ourselves with the help of an electrician. Technically it was simple; administratively it was painful. The hardest part was getting approval from the building's energy supplier. Once installed, it's been flawless.

5. How do you feel about the availability of public charging points in Munich or when traveling in general?

In Munich, I'd say it's quite good compared to other German cities. Near Neuperlach there are several reliable stations. When we travel, though, the picture is inconsistent — in some rural areas chargers are far apart or temporarily offline. It's improving, but the experience still depends on luck.

6. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?

Maybe a three. We're in a fortunate situation with private charging, but I can imagine it being an eight or nine for renters without that option.

7. If you could change one thing about charging, what would it be?

I'd standardize the systems — one universal card or app for every charging provider. The fragmentation is confusing and unnecessary. It should be as simple as plugging in your phone.

Block 5 – Conclusion

1. Is there anything I haven't asked you about e-mobility or charging that is important to you? Yes I think awareness is key. Many people still view electric mobility as something complicated or elitist, but it's really just a different routine.

CONCLUSION – End of interview

Interview 2

A. Jaser, 41, Accountant ?, Munich

Block 0 – Introduction

- 1. Could you briefly tell us where you live and how you get around in your everyday life?**

I live in Sendling with my wife and two kids. Most of the time I use public transport, the U-Bahn and sometimes my car when I take the kids to sports or when we visit family outside Munich. I drive an older diesel, but it still runs fine.

- 2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason? If no → Have you ever considered switching to an electric car?**

No, I don't have one. I've thought about it a few times, especially with all the talk about e-mobility, but to be honest, it just doesn't seem practical for me yet. I park on the street and there's no charger nearby. Also, I drive maybe 10,000 km a year, so it's not really worth it.

- 3. How important is sustainability or e-mobility to you in general?**

It's important, of course. I recycle, we use energy-saving appliances, and I try not to drive when I don't need to. But I think e-mobility is more for people who own their homes or have stable charging options. For renters like me, it's still complicated.

- 4. How many people in your household or circle of friends already have an electric car?**

A few colleagues at work have company cars that are electric, and one of my friends bought a Tesla recently. They like it, but they all have garages or private parking. None of my close neighbours own one yet.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

I think it's definitely cheaper in the long run, and I like the idea of no emissions in the city. Also, it's quiet when I see them passing, they look smooth and modern. I wouldn't mind driving one if it was easier to charge.

2. And what is currently preventing you (or others you know) from doing so?

Mainly the price and the lack of charging near my home. Even used electric cars are still expensive. Plus, the batteries — I don't know enough about how long they last or how much replacement costs. So, it feels risky to invest right now.

Block 2 – Everyday life / current charging situation (for potential buyers)

3. If you imagine you had an electric car today, where would you charge it?

That's the main problem I honestly don't know. There's one charging station about a ten-minute walk away, but it's usually occupied. I can't imagine parking there every night.

4. Are there charging options where you live, e.g., public charging stations or parking spaces?

Yes, there are a few around the neighbourhood, but not enough. And many are slow chargers. Sometimes I see people leaving their cars there for hours. It's not convenient unless you live right next to one.

5. How realistic would it be for you to charge there regularly in everyday life?

Not realistic at all for me right now. Maybe if I moved somewhere with a private parking space, I'd think about it again.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

Finding a place to charge would be the biggest problem. I don't have a garage, and I can't run a cable from my building. That's the main reason I haven't made the switch.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Yes, many times. Every time I think about all the logistics — apps, charging, time, I decide it's just easier to keep what I have until the infrastructure improves.

3. If you live in an apartment building or rental property: What is the attitude towards wallboxes there?

No one in our building has one. I think most people wouldn't even know where to start. The landlord is old-fashioned, and I doubt he'd agree to install one.

4. **Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?**

No, personally I haven't. A friend of mine in Augsburg tried, and it took months of permits and electrician visits. That put me off even more.

5. **How do you feel about the availability of public charging points in Munich or when traveling in general?**

In Munich it's improving, but still not enough. When I go outside the city, especially towards smaller towns, it's even worse. For people like me, it feels like e-cars are made for homeowners, not renters.

6. **On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?**

Definitely a 9. That's the main reason I haven't switched.

7. **If you could change one thing about charging, what would it be?**

More chargers in residential areas. If there were reliable stations on every street, I'd seriously consider getting one.

Block 5 – Conclusion

1. **Is there anything I haven't asked you about e-mobility or charging that is important to you?**

No

CONCLUSION – End of interview

Interview 3

K. Brammer, 32, Software Developer, Munich

Block 0 – Introduction

1. **Could you briefly tell us where you live and how you get around in your everyday life?**

I live in Haidhausen, close to Ostbahnhof. Most of the time I either cycle or take public transport, but I do use my electric car quite a lot, especially on weekends or when I go to visit family near Augsburg. I work partly from home, so I don't drive daily, but it's still nice having the car for flexibility.

2. **Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason?**

Yes, I drive a Polestar 2. I bought it in 2022, so it's been almost two years. My main reason was a mix of curiosity and values. I work in tech, so I'm drawn to innovation, and I wanted to try how well this goes. But I was also tired of the guilt that comes with driving petrol.

3. **How important is sustainability or e-mobility to you in general?**

I'd say it's part of my lifestyle but I'm not activist and I'm not fully dedicated to sustainable life but e-mobility is definitely very positive.

4. How many people in your household or circle of friends already have an electric car?

Quite a few actually. In my friend group, at least four of us have switched. It's becoming a bit of a trend, especially among younger professionals.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

For me, it's comfort and control. The car drives so smoothly and quietly that you almost forget you're moving. I also love that I never have to stop for gas I charge at home overnight, and it's ready in the morning. Instant acceleration feels futuristic.

2. And what is currently preventing you (or others you know) from doing so?

Mostly infrastructure and cost. Some of my friends live in rented apartments and can't install wallboxes. Others say the initial price is still too high, even with incentives. And of course, the fear of battery degradation people still don't fully trust the long-term lifespan.

Block 2 – Everyday life / current charging situation (for electric car owners)

1. How do you currently charge your car? At home, in public, at work, on the road?

I charge mostly at home. I live in a new apartment building that already had charging spots in the underground garage, so I rent one of those. I also charge at my office occasionally since the company installed a few chargers last year.

2. How well does this work for you in everyday life? Where does it work well, where does it fall short?

It works perfectly 95% of the time. The only time it falls short is when I forget to plug in overnight and realize in the morning that I'm at 15%. Then I need to use a fast charger before driving out of the city, which adds time. But overall, the routine is easy it's much less stressful than I imagined before buying.

3. Have there been times when you couldn't find a charging point or had to change your plans?

A few times, yes. Once during a trip the charger on the route was broken and the next one was 20 kilometres away. It wasn't dramatic, but it did make me more aware of planning ahead. Inside Munich, I've never had that issue there are plenty of chargers now.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

Public chargers that don't work or are blocked by other cars. Sometimes I arrive at a charging spot and see a combustion car parked there "just for a minute." It's frustrating because there's no proper enforcement.

- 2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine**

Maybe once or twice when I was in a hurry and couldn't find a working charger on a long trip. But overall, no — the benefits outweigh those rare frustrations. I can't imagine going back to petrol now.

- 3.If you live in an apartment building or rental property: What is the attitude towards wallboxes there?**

Pretty positive, actually. Our building was designed with sustainability in mind, so having wallboxes was part of the plan. Everyone seems okay with it — there's even a waiting list for the remaining spots.

- 3. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?**

I didn't have to personally, since it was already installed. But my colleague went through the process and said it was quite smooth thanks to his landlord being open-minded. The hardest part seems to be getting approval when you're renting in an older building.

- 4. How do you feel about the availability of public charging points in Munich or when traveling in general?**

Munich is doing well compared to other cities I've visited. When I drive to Cologne or Nuremberg, I notice that charging stations are less frequent. It's getting better, though every few months I see new ones being built.

- 5. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?**

Maybe a two. I'm lucky to have easy access, but I know that's not the case for everyone.

- 6. If you could change one thing about charging, what would it be?**

I'd love a standardized system one app, one payment method, one plug type. Right now it feels a bit fragmented, and new users find that confusing.

Block 5 – Conclusion

- 1. Is there anything I haven't asked you about e-mobility or charging that is important to you?**

Just that people should give it a try before forming an opinion.

CONCLUSION – End of interview

Interview 4

T. Neumann, 46, IT Support, Munich

Block 0 – Introduction

1. Could you briefly tell us where you live and how you get around in your everyday life?

I live in Moosach with my wife. We both work full-time, so the car is an important part of our daily routine. Munich's public transport is good, but with our schedules, it's not always practical.

2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason?

Yes, I bought a BMW i4 about a year and a half ago. My company encouraged the switch they offered a subsidy for employees who chose electric company cars. I was excited at first because it felt like a modern step forward, and I believed it would save costs in the long term.

3. How important is sustainability or e-mobility to you in general?

It's important, but to be honest, not my top priority. I appreciate the idea of clean mobility, but my decision was more practical than ideological. I wanted something efficient, quiet, and suitable for long drives. I do care about reducing emissions, but it's not the only factor in my choices.

4. How many people in your household or circle of friends already have an electric car?

A few. Two of my colleagues also drive electric cars, and one of my neighbours just switched to a hybrid. Most of my friends are still using combustion cars, and after hearing about my experiences, many of them are waiting before making the jump.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

It's quiet and powerful the acceleration is really smooth. For city driving, it's actually perfect. In summer, it feels like the ideal car.

2. And what is currently preventing you (or others you know) from doing so?

Infrastructure and reliability. When everything works, it's great but when it doesn't, it's stressful. Chargers that don't start, slow apps, occupied charging stations... these things can ruin your schedule. That's what discourages most people I talk to.

Block 2 – Everyday life / current charging situation (for electric car owners)

1. How do you currently charge your car? At home, in public, at work, on the road?

Mostly in public. We live in an apartment without private parking, so I rely on public chargers around Moosach or near my office. I also charge on the road when I travel for work.

2. How well does this work for you in everyday life? Where does it work well, where does it fall short?

When I find a free charger, it's fine. But that's not always easy in the evenings, most of them are already occupied. Sometimes I end up driving around for fifteen or twenty minutes just to find a spot. I also notice that some chargers are really slow, even though they're advertised as "fast."

3. Have there been times when you couldn't find a charging point or had to change your plans?

Yes, several times.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

The inconsistency. You never really know if a charger will work. The apps sometimes fail to connect, or the payment doesn't go through. Also, the prices vary a lot one station costs 30 cents per kWh, another almost 80. There's no transparency.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Yes, absolutely. I even considered switching back at one point. After a long trip where I spent more time looking for chargers than actually driving, I really missed the simplicity of just stopping for gas.

3. If you live in an apartment building or rental property: What is the attitude towards wallboxes there?

Pretty negative, honestly. The building management says it's too complicated and expensive to install charging infrastructure. A few tenants asked, but nothing has moved forward. That's part of why I have to rely on public charging.

4. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?

One of my friends tried to install one at his house near Dachau, and it took months of waiting for the energy provider's approval. For me, it's not even an option since I rent.

5. How do you feel about the availability of public charging points in Munich or when traveling in general?

In Munich, it's okay but still too limited compared to the number of new EVs. Outside Munich, especially in smaller towns, it becomes a problem. I've had to rely on hotel chargers during business trips, and sometimes they're slow or reserved for guests only.

6. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?

I'd say a 7. It's manageable, but not smooth. Charging should be simple, not something that requires planning and patience every day.

7. If you could change one thing about charging, what would it be?

I'd like more fast chargers in residential areas and better maintenance of existing ones. Also, a unified payment system would make things easier.

Block 5 – Conclusion

1. Is there anything I haven't asked you about e-mobility or charging that is important to you?

No.

CONCLUSION – End of interview

Interview 5

S. Becker, 39, Embedded S.E.

Block 0 – Introduction

1. Could you briefly tell us where you live and how you get around in your everyday life?

I live in Schwabing with my husband. I work freelance, so my schedule is flexible sometimes I work from home. I take public transport, but I used to have an electric car that I drove almost daily for about two years.

2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason? If no → Have you ever considered switching to an electric car?

No, not anymore. I sold my electric car last year. I had a Renault Zoe that I bought in 2021, mostly because I wanted to try e-mobility and take advantage of the government incentives. It was fun and definitely different, but in the end, I realised it didn't fit my lifestyle as much as I hoped.

3. How important is sustainability or e-mobility to you in general?

Very important. I still believe e-mobility is the future and that cities should move

in that direction. I just learned that for people like me who live in rented apartments without stable parking it's not always easy to make it work. I still support the idea 100%, even if I'm not driving electric at the moment.

4. How many people in your household or circle of friends already have an electric car?

Several. My brother drives a Tesla Model 3, and one of my close friends has a hybrid. They both have private parking spots, which makes all the difference. Most of my other friends are interested but still waiting for better infrastructure.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

It was incredibly quiet and smooth that was what I loved most. The running costs were also lower, and I really liked the feeling of driving something cleaner.

2. And what is currently preventing you (or others you know) from doing so?

For me, it was mostly the charging situation. I couldn't charge at home, so I relied on public chargers. At first, it seemed fine, but it quickly turned into a daily challenge. Also, when I moved to a new apartment, the nearest station was often full. I didn't want my life to revolve around finding a charging spot.

Block 2 – Everyday life / current charging situation (for former electric car owners)

1. How did you charge your car when you owned it? At home, in public, at work, on the road?

I charged exclusively at public stations. There was one about 300 meters from my apartment, and another near the supermarket.

2. How well did this work for you in everyday life? Where did it work well, where did it fall short?

It worked okay when I planned everything carefully, but that's the problem you always have to plan. You can't just decide to go somewhere spontaneously. The best experience was when I combined shopping with charging, but that's not always possible.

3. Have there been times when you couldn't find a charging point or had to change your plans?

Yes, too many times. I once had to cancel a meeting because every charger in the area was occupied. That was when I started thinking maybe this just doesn't fit how I live.

Block 3 – Problems & Barriers

1. What were the biggest challenges or annoyances when it came to charging – for you personally?

The waiting and the uncertainty. It's not like filling a tank in five minutes. You always need to think ahead how much range you'll need, where the next charger is, and if it'll even work. That mental load made me feel like the car was controlling me, not the other way around.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Yes, that's exactly why I sold it. I was spending too much time planning around charging, and it became stressful. I ended up using my husband's petrol car more often, which defeated the purpose. Eventually, I sold the Zoe and went back to sharing one car between us.

3. If you live in an apartment building or rental property: What was the attitude towards wallboxes there?

Nobody was against it, but nobody cared enough to make it happen either. The landlord said he'd "consider it in the future," but that never happened. Everyone just parked wherever they could. Without a private charger, it's hard to commit to an EV long term.

4. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?

Not personally. A friend in Sendling tried and gave up after months of paperwork. For renters, it's just not worth the trouble.

5. How do you feel about the availability of public charging points in Munich or when traveling in general?

In Munich it's better than in other cities, but it's still not reliable. Sometimes chargers don't work, or they're blocked. Outside the city, it's a gamble. For a big European city, we should have a much denser network by now.

6. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?

For me, it was a 9. That's the main reason I gave up on owning an EV.

7. If you could change one thing about charging, what would it be?

Every residential building should have at least a few chargers for tenants. If that existed, I'd go electric again tomorrow.

Block 5 – Conclusion

1. Is there anything I haven't asked you about e-mobility or charging that is important to you?

Just that people often judge those who give up on EVs too quickly, but sometimes it's not about preference it's about practicality.

CONCLUSION – End of interview

Interview 6

M. K, 43, QA Engineer, Munich

Block 0 – Introduction

1. Could you briefly tell us where you live and how you get around in your everyday life?

I live in Bogenhausen with daughter and wife. I work in the city, so I use a mix of transport mostly biking public transport during the week, and our electric car for longer commutes or when visiting family outside Munich. The car isn't something we use every day, but when we do, it's an important part of our routine.

2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason?

Yes, we have a Tesla, which we bought about a year and a half ago. The main reason was practicality we needed a family car anyway, and it made sense to go electric instead of buying another combustion one. I was also curious to experience e-mobility firsthand, especially as an architect, since I design sustainable buildings and wanted to align my lifestyle with my professional values.

3. How important is sustainability or e-mobility to you in general?

It's quite important. I believe cities like Munich should move toward cleaner mobility, and as someone working in architecture and planning, I see how transportation and energy use are deeply connected.

4. How many people in your household or circle of friends already have an electric car?

It's becoming common. My business partner drives a Tesla, and two friends recently switched to smaller electric models.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

The main advantage is comfort. The car is incredibly quiet, and the driving experience feels effortless. about.

2. And what is currently preventing you (or others you know) from doing so?

Mostly cost and convenience. Many of my colleagues want to switch but hesitate because of high upfront prices or because they live in apartments without access to chargers.

Block 2 – Everyday life / current charging situation (for electric car owners)

1. How do you currently charge your car? At home, in public, at work, on the road?

I charge mostly at home. We live in a new residential building where wallboxes were installed from the start, which makes everything much easier.

Occasionally, I charge at work when we have longer office days, or at highway stations when we travel to visit family.

2. How well does this work for you in everyday life? Where does it work well, where does it fall short?

At home, it works perfectly plug in at night, it's ready by morning. Public charging can still be hit or miss. Some chargers are really well-maintained, others are slow or busy. But since 90% of our charging happens at home, it's not a major problem.

3. Have there been times when you couldn't find a charging point or had to change your plans?

Not really in Munich, but on one trip to Italy last summer, yes. We arrived at a highway station late in the evening, and all chargers were occupied. We had to wait about forty minutes, which wasn't ideal with a tired child in the back. It reminded me that even good planning sometimes isn't enough.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

The inconsistency of public infrastructure. It's improving, but there's still no standard different operators, apps, and plug types. Also, some chargers are poorly maintained or out of order for weeks. It's frustrating when technology that's supposed to make life easier ends up wasting your time.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Maybe during that Italy trip. We were tired, and waiting for a charger felt endless.

3. If you live in an apartment building or rental property: What is the attitude towards wallboxes there?

Positive. Our building was developed with sustainability in mind, so residents were actually happy about having chargers.

4. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?

Yes, we had one installed through the developer's contractor. It was straightforward because the wiring was already in place. Friends in older

buildings, though, had a harder time approvals, costs, waiting times. It really depends on the building.

5. How do you feel about the availability of public charging points in Munich or when traveling in general?

In Munich, it's fairly good — much better than two years ago. There's a charging station near every major supermarket now. But outside cities, it's still inconsistent. Germany is improving, but slower than the demand is growing.

6. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?

For me personally, maybe a two. But for many people in older buildings, I'd imagine it's an eight or nine. It's very situational.

7. If you could change one thing about charging, what would it be?

A single, unified payment system. It's ridiculous that we need several apps and accounts just to charge. It should be as easy as tapping a card and plugging in.

Block 5 – Conclusion

1. Is there anything I haven't asked you about e-mobility or charging that is important to you?

Just that the success of e-mobility depends as much on planning as it does on technology.

CONCLUSION – End of interview

Interview 7

L. Novak, 29, UX Designer, Munich

Block 0 – Introduction

1. Could you briefly tell us where you live and how you get around in your everyday life?

I live in Maxvorstadt with my girlfriend. We both work in creative fields, so we don't have fixed hours sometimes we go to the office, sometimes we work remotely. I use a car mainly for everything.

2. Do you currently have an electric car, hybrid, or combustion engine vehicle? If yes → Since when and what was your main reason?

Yes, we bought a used Hyundai Kona Electric about a year ago. It was a bit of an impulse decision we wanted a car but didn't want to deal with fuel prices or maintenance issues. Also, I grew up in Prague, where the air pollution is worse, and I wanted to do my part, even in a small way.

3. How important is sustainability or e-mobility to you in general?

Quite important. I'm not extreme about it, but I think if you have the option to make a cleaner choice, you should. Sustainability is something that should feel natural, not forced.

4. How many people in your household or circle of friends already have an electric car?

Not many I'd say two or three. Most of my friends are still students or live in shared apartments, so they can't have one yet. But everyone's curious; they often ask me how it works, how much I spend on charging, stuff like that.

Block 1 – E-mobility

1. What are the advantages of an electric car for you personally?

Definitely the quietness and simplicity. You just get in, press a button, and go no noise, no shaking, no smell. I also love that I can charge it while sleeping and not think about petrol stations. And it feels great knowing I'm not polluting the air where I live.

2. And what is currently preventing you (or others you know) from doing so?

Mainly cost and housing situations. Most of my friends rent and park on the street, so home charging isn't an option. And even though prices are coming down, new EVs are still expensive for people under thirty.

Block 2 – Everyday life / current charging situation (for electric car owners)

1. How do you currently charge your car? At home, in public, at work, on the road?

Mostly at public stations.

2. How well does this work for you in everyday life? Where does it work well, where does it fall short?

It works well most of the time. I'd say 80% of my charging is stress-free. The only annoying part is when someone leaves their car plugged in for hours even after it's full.

3. Have there been times when you couldn't find a charging point or had to change your plans?

Once or twice, yes.

Block 3 – Problems & Barriers

1. What are the biggest challenges or annoyances when it comes to charging – for you personally?

I'd say the lack of etiquette. Some people treat public chargers like private parking spots and leave their cars there all night.

2. Have there been situations where you thought: This is too much hassle, I'd rather stick with a combustion engine?

Not really. It can be annoying sometimes, but overall, the positives outweigh the negatives.

3. If you live in an apartment building or rental property: What is the attitude towards wallboxes there?

Neutral, I'd say. Nobody in the building has one yet, but the landlord mentioned they're considering installing shared chargers next year.

4. Have you or anyone you know ever tried to install a wallbox? How easy or difficult was it?

No, not personally. But one colleague from work had a nightmare getting approval from his homeowner's association.

5. How do you feel about the availability of public charging points in Munich or when traveling in general?

In Munich, it's actually quite good. Every few months, I see new ones being added. Outside Munich, especially toward smaller Bavarian towns, it's thinner, but still manageable if you plan.

6. On a scale of 1 to 10, how big of an obstacle is charging / wall boxes for you?

Probably a 4. It's not perfect, but not a dealbreaker either.

7. If you could change one thing about charging, what would it be?

More transparency in the apps live updates, working status, and maybe some kind of public etiquette reminder.

Block 5 – Conclusion

1. Is there anything I haven't asked you about e-mobility or charging that is important to you?

No

CONCLUSION – End of interview
